

INK-JET RECORDING APPARATUS

Ins A 7

BACKGROUND OF THE INVENTION

1. Field of the Invention

5 The present invention relates to an ink-jet recording apparatus which ejects ink droplets from nozzles to write a recording image such as characters on a recording medium, and more particularly to a structure of an ink supply channel for introducing ink from an ink storage tank to an ink-jet
10 recording head.

2. Description of the Prior Art

 An ink-jet recording apparatus which ejects ink droplets from nozzle openings to print characters and images on a recording medium is provided with a filter plate between an
15 ink tank and a recording head in order to eliminate dust particles and bubbles in ink.

 However, as the number of nozzle openings provided in a recording head is increased to 64 and further to 128 for improving the resolution of printed images to permit a larger
20 amount of ink to flow from the ink tank to the recording head, larger head losses are induced by the filter plate for preventing foreign substances from flowing into the recording head, whereby supply of ink to the recording head cannot catch up with an amount of ink consumed for recording.

25 To solve the problem as mentioned above, the opening area of the filter plate need be increased to reduce a fluid
